

Archimedes Screw

The [Archimedes screw](#) is a spiral-shaped device that rotates as water moves up and down the device. These devices are generally bottom-mounted or use a taut anchoring system on floating platforms to maintain the necessary angle for energy capture. Very few of these devices exist and the technology is still being developed.

Bottom-mounted [Tidal Helix Screw](#) by Flumill

[Tidal Platform](#) by Jupiter Hydro Inc that can be mounted on a fixed or floating platform
