

Oscillating Wave Surge Converters

[Oscillating wave surge converters](#) generally consist of a flap-like body affixed to a surface that moves against the horizontal motion of the waves. The hinge of the flap is able to generate electricity through a turbine or hydraulic generator. As most of these devices are attached to the seafloor, shoreline, or a dock, there is no to little mooring line strategy.

[Eco Wave Power Wave Clapper](#) attached to a dock.

[BioPower Systems](#) Pty Ltd. bioWAVE on the sea floor.

Some oscillating surge converters overlap with point absorbers, specifically the Wave Energy Converter Nankun and the Changshan Sharp Eagle as listed in the above *Point Absorbers* section. Contrary to most oscillating wave surge converters, these bases are large (up to 300m long), and rely on thick, catenary chain moorings.
